

Protect Cash and Reduce Costs in Shared Services

Accounts Payable teams everywhere are under pressure to keep invoice processing costs low while preventing risks to their working capital from entering their cashflow.

We have seen major changes in the way invoices are received and processed, and in the types of risks occurring, making now the time for additional controls that protect your vendor spend.

Protecting Cash

Systems and processes change, and steps taken to prevent supply chain interruption introduce new ways for invoice exceptions to evade your existing controls. Little wonder, they were designed for 2020 BC - Before Covid.

In certain sectors, external threats of fraud and decreasing DSO have led to further pressure on AP to protect working capital. Accelerated by the pandemic, the amount of risk you are exposed to has increased, and traditional controls have become out-dated.

Reducing Costs

Early detection of risks removes them from processing - saving time and money. AP teams don't need to process an invoice only to find out later that it shouldn't have been paid.

Furthermore, identifying the source of repeated inquiries and rework leads to significant cost saving through process improvements. Our solution enables AP teams to achieve best-in-class performance and best-practice compliance without a major system or process overhaul.

Designed for Shared Service Centers

We work with dozens of Shared Service Centers in the commercial and public sectors. With 17 years of experience in this area, our customers have told us what they require, and we have built it. Our customers are preventing tens of millions of dollars in invoice payment leakage per annum.

Our SaaS-based solution fits around your existing AP processing, augmenting your team with risk intelligence garnered from forensic-level, AI-enhanced vendor and transaction analysis.

INCREASE YOUR VISIBILITY OF RISKS

KEY BENEFITS:

- Payback within 2-3 months
- 5x to 10x ROI
- Productivity improvements
- Minimal disruption
- Continuous risk protection
- Errors and exceptions found before payment
- Every transaction and vendor analysed
- Combined forensic and AI-powered analysis
- Find and remove processing inefficiencies
- Designed for the scale and velocity of Shared Service Centers
