

Single sign-on

Secure login to increase security and simplify the login process for users.

The problem.

Without Single Sign On (SSO), users need to remember individual passwords for each system they log in to. This is both a poor user experience and presents multiple security risks.

Single Sign On is often implemented as part of a broader identity and access management (IAM) protocol, to help organisations to comply with regulations that require strong authentication and access control.

The solution.

FISCAL's software integrates with OpenID Connect (OIDC) standard SSO, to help keep your finance data secure, and your systems compliant. You will receive dedicated support from the FISCAL team throughout implementation. It's simple to integrate, and works with all leading OIDC SSO implementations.
